Product owner for SaaS. 5+ years owning roadmaps, backlogs, and prioritization with stakeholders.

Skills

Product	Roadmapping, backlog prioritization (RICE, WSJF), user stories, acceptance criteria, KPI definition, UAT, PRDs
Delivery	Agile, Jira, Confluence, sprint planning, defect triage
Technical	JavaScript, TypeScript, SQL, React, Node.js, PostgreSQL

Education

Degree	B.Tech, Computer Science
University	REVA University
Location	Bengaluru, India
Dates	2017 – 2021

Professional Experience

Karya — 2024 – Present

Senior Product Engineer — *Bengaluru, India*

Product owner for the data-collection and worker-payments platform. Owned the roadmap, backlog, and prioritization with operations, finance, support, and product stakeholders.

- **Roadmap:** Owned **Platform by Karya** end to end. The product has deployed **65M+ tasks**, supports **70+ languages**, and runs in **6 countries** across the Global South.
- **Stakeholders:** Programs on that platform include **Project Vaani** with Google and IISc (**6,000 hours**, 24K+ speakers, 30 districts), **Project Apollo** (**100,000 hours** across 22 languages, 60,000 workers, **$2M** disbursed), **Samiksha** with Microsoft (**23,000+** real-world queries, **150,000+** human evaluations), and an **Anthropic** evaluation (**10,000** community queries, **30,000+** tasks, 7 languages).
- **Backlog:** Turned task creation into configuration. **30+ components**, including audio transcription, image annotation, and fill-in-the-blanks, so operations can assemble a new data-collection task, including for low-bandwidth and low-literacy workers, without a new build.
- **User stories:** Owned **Task Preview** from the problem through launch. Wrote the PRD with user stories, locked decisions as acceptance criteria, and non-goals. **Every new task** starts in Preview and moves to Live only after an internal check and approval from the operations team, with payouts off during testing. Task issues fell by **close to 90%**, a data operation takes **more than 50% less time**, and satisfaction on the ground improved, with data and operations working from the same check.
- **Defect triage:** Defined **Task Health** as the checklist on the task page: **7 automated checks** (assignments, microtasks, completion policy, upstream tasks, avatar linking, rejected work, and boxes). Each check opens the screen that fixes it, so coordinators clear blockers without an engineer.
- **Prioritization:** Replaced hand-edited database access with a self-serve roles UI. **4 global and 5 project roles**, permissions in code, across **100+ API routes**. Provisioning went **from hours to seconds**, and inactive users are denied.
- Shipped **plain-English queries** over live PostgreSQL, with history and reusable templates, so internal non-technical teams can look up operational data on their own without asking the tech team.

ZopSmart — 2022 – 2024

Product Engineer — *Bengaluru, India*

Product scope on grocery, HR, and consumer SaaS. Prioritized with stakeholders and shipped from the backlog through launch.

- **Data-driven: Kroger (US Grocery e-Commerce):** Shipped the homepage and category-discovery redesign on the **2nd-largest US grocery e-commerce SaaS**. Click-through rose **3**× and product sales rose **12%**.
- **Roadmap: EazyUpdates (Task-Management SaaS):** Owned **50% of the product**, including leave and payroll tracking for HR stakeholders and **GitHub and Google Calendar** integrations for live progress visibility.
- **Smrize (Productivity SaaS):** Shipped a mobile-first book-summary app with audio. Traffic rose **20%**, with **24-minute average daily sessions**.

MountBlue Technologies — 2021 – 2022

Software Engineer — *Bengaluru, India*

Product scope for a two-sided marketplace: landlords listing properties and tenants browsing and enquiring.

- **User stories:** Shipped the **e-property listing marketplace** with a responsive, accessible UI and unit and integration test coverage.
